# Utah REIA Analytics Dashboard: Data Checklist and Table Plan

Written by David. Tell me what I missed.

## What this is

My rock for the next 60 days is an analytics dashboard, and this is how I plan to build it. It shows every number we care about in one place. Where leads come from. Who turns into a member. What works and what does not.

This doc has two parts. Part 1 is the checklist of where the data lives and what I will collect. Part 2 is the table I plan to build in Supabase to hold it all.

## The plan in one minute

Right now our data sits in many places: GHL, Airtable, Vapi, Supabase, and GA4. None of them agree on one ID. My plan is simple. I will send every event into one Supabase table. I will match people by the last 10 digits of their phone number, and also keep their GHL contact ID. Then the dashboard reads from that one table.

## What I want the dashboard to answer

- How many leads come in, and from where?
- Which leads become members, and how long does it take?
- Which channels and campaigns work best?
- Where do we lose people?

# Part 1: The checklist

## 1. Lead sources

| Source | Where it lives | What I pull |
|---|---|---|
| Facebook, LinkedIn, other social | Social Media Analytics (Supabase), GHL social planner | Posts, impressions, reach, likes, comments, shares, clicks, followers, leads by platform |
| Website forms | GHL | Form name, submit time, contact ID, UTMs |
| Surveys | GHL and Deal Access Requests (Airtable) | Survey name, calculator type, priority score |
| Lani voice agent | Vapi and `voice_agent_calls` | Calls, length, caller type, matches, outcome |
| Phone calls (main line and team) | GHL call logs | Inbound and outbound, answered or missed, length, who handled it |
| Texts (SMS) | GHL conversations, Lani follow-up text | Sent, delivered, failed, replies, opt-outs, link clicks |
| Emails | GHL campaigns and workflows, Gmail (listing alerts, digest) | Sent, delivered, clicked, bounced, unsubscribed, replies |
| Social DMs and chat widget | Facebook, LinkedIn, GHL conversations | Messages in, replies, who they came from |
| GHL workflows | GHL | People entered, finished, dropped out, and what happened after |
| GHL opportunities | GHL pipelines | Pipeline, stage, value, owner, source, date moved, won or lost |
| GHL custom objects | GHL, copied nightly into Supabase | Vendor directory: vendors in, promoted, active |

| Source | Where it lives | What I pull |
|---|---|---|
| Calculators (5) | Airtable Verifications | Phone checks, member or trial, first access date, which calculator |
| Rehab Estimator | Airtable subscribers | Subscribes, cancels, active count |
| Property and notes marketplace | Airtable (3 bases) | Listings added, inquiries, subscribers, expirations |
| Events | GHL | Registered, attended, no-shows |
| Appointments | GHL calendars | Booked, showed, no-showed |
| Direct, organic, referral | GA4 | Sessions by channel and landing page |

## 2. Data I collect on every lead

- Contact ID, phone, email, name
- First touch: source, medium, campaign (UTMs)
- Last touch: what pushed them over the line
- Date and time of first touch
- Entry point (form, survey, voice, tool, listing, event)
- Investor or vendor
- Stage and strategy (from Lani)

## 3. Steps in the funnel

- Lead created
- Engaged (used a calculator, finished a call, got matches)
- Trial started
- Member
- Trial ended and did not convert
- Vendor enrolled
- Referral sent to a partner ( `vendor_referrals` )

## 4. Voice agent numbers

- Calls per day, average length, finished vs dropped
- Match rate, and how often `find_resources` finds nothing
- Confidence spread (high, medium, low)
- Follow-up SMS sent and clicked
- V1 and V2 side by side while we move over

## 5. Tools and deal center numbers

- Uses per calculator, and how many people finish an analysis
- Trial to member rate for each calculator
- Listings posted, inquiries per listing, listings that expired
- Digest subscribers and growth

## 6. Calls, emails, texts, and other messages

I want to track every message we send and get. Then I can see which ones move people forward.

- **Phone calls:** Lani calls and calls to our main number. Answered or missed, how long, and what happened after. Sources: Vapi and GHL call logs.
- **Texts (SMS):** sent, delivered, failed, replies, opt-outs, and link clicks. This includes the Lani follow-up text and workflow texts.
- **Emails:** sent, delivered, clicked, bounced, unsubscribed, and replies. This includes GHL campaigns, workflow emails, the listing alerts, the daily digest, and verification codes. Open rates are not fully reliable, so I will not lean on them.
- **Social messages:** Facebook and LinkedIn DMs, and chat widget messages, if we use them.
- **Appointments:** calls or meetings booked from any message.
- **For every message I save:** the contact, in or out, the channel, the workflow or campaign name, the time, the status, and what the person did next (replied, clicked, booked, joined).

## 7. GHL objects, workflows, and opportunities

I want to track what lives inside GHL, not just what comes in.

- **Opportunities:** each pipeline, stage, value, owner, source, date created, date moved, and won or lost. This shows me where leads get stuck.
- **Custom objects:** the vendor directory (vendors in, promoted, active) and any other custom object. I read these from the nightly Supabase copy, because GHL blocks outside servers on them.
- **Workflows:** for each one, how many people enter, finish, and drop out, and what happened after. I will start with "Utah REIA Voice Agent Lead (Lani)" and "Vendor Review Outcome." I still need to check what GHL lets me read here. If it will not give me the counts, I will have each workflow send us an event when someone enters and finishes.
- **Tags and custom fields:** member tags, the calculator access field, lead source, and status fields. These tell me who is a member.
- **Contacts:** created per day, source on the contact, and owner.

## 8. Social media numbers

- **Per post:** platform, date, type (post, story, reel), impressions, reach, likes, comments, shares, saves, link clicks, and video views.
- **Per account, per day:** new followers and profile visits.
- **Tie posts to leads:** every link in a post gets UTMs, so a new lead traces back to the post that brought them in.
- **Sources:** Social Media Analytics (Supabase), the GHL social planner, and Facebook and LinkedIn directly. Each platform gives different numbers, so I will check what each one really gives me.

## 9. Money and partners

- New members and cancels
- Rehab Estimator subscriptions
- Partner referrals and billing
- Needs we could not match. This tells us which vendors and educators to go find.

## 10. Gaps I need to fix first

- **UTMs.** I need to check that every entry point saves them. The Lani widget, the calculators, and the listing page are the most likely holes.

- **One ID.** Airtable, GHL, Vapi, and Supabase use different keys. I will match on phone last 10 digits.
- **GHL custom objects.** They block outside servers (403). I will keep using the nightly mirror into Supabase.
- **Old data.** Some tables have no source field. Those leads show as "unknown" until we start tracking.

### 11. Chris, I need your call on these

- What counts as a "lead" to you? Any contact, or only someone who took an action?
- What counts as a "member" when we measure conversion? Paid, active tag, or something else?
- Which numbers do you look at every week? I will build those first.

## Part 2: The table plan

I want two tables. One for people, one for things that happen.

### `leads` (one row per person)

This holds who they are and where they first came from.

- `phone_last10` is the main match key. It is unique.
- `ghl_contact_id` links back to the CRM.
- First touch fields are set once and never change.
- `member_status` and `member_since` get updated as they move through the funnel.

### `lead_events` (one row per thing that happens)

Every form, call, calculator use, listing, and event goes here as a new row. We never edit old rows. This makes it easy to count anything later.

```
create table leads (
  id              uuid primary key default gen_random_uuid(),
  phone_last10    text unique,
  ghl_contact_id  text,
  email           text,
  full_name       text,
  caller_type     text,   -- investor | vendor
  stage           text,
```

```
  strategy        text,
  first_touch_at  timestamptz,
  first_source    text,
  first_medium    text,
  first_campaign  text,
  entry_point     text,   -- form | survey | voice | tool | listing | event
  member_status   text default 'lead',  -- lead | trial | member | lapsed
  member_since    timestamptz,
  created_at      timestamptz default now()
);

create table lead_events (
  id               uuid primary key default gen_random_uuid(),
  lead_id          uuid references leads(id),
  occurred_at      timestamptz not null,
  event_type       text not null,
  source_system    text not null,  -- ghl | vapi | airtable | ga4 | social
  source_record_id text not null,  -- the ID in the original system
  channel          text,           -- facebook | linkedin | form | survey |
voice | calculator | listing | event | direct
  utm_source       text,
  utm_medium       text,
  utm_campaign     text,
  utm_content      text,
  utm_term         text,
  landing_url      text,
  tool_name        text,           -- which calculator, if any
  metadata         jsonb default '{}'::jsonb,
  created_at       timestamptz default now(),
  unique (source_system, source_record_id, event_type)
);

create index on lead_events (occurred_at);
create index on lead_events (event_type, occurred_at);
create index on lead_events (channel, occurred_at);
create index on lead_events (lead_id, occurred_at);
```

The `unique` line matters. It means I can run a sync twice and not get double counts.

## Event types I will start with

`lead_created`, `form_submitted`, `survey_submitted`, `call_completed`, `matches_returned`, `no_match`, `sms_sent`, `sms_clicked`, `calculator_unlocked`, `analysis_finished`, `trial_started`, `trial_expired`, `member_activated`, `member_cancelled`, `listing_posted`, `listing_inquiry`, `event_registered`, `event_attended`, `vendor_enrolled`, `partner_referral_sent`, `call_inbound`, `call_outbound`, `call_missed`, `sms_delivered`, `sms_failed`, `sms_replied`, `sms_opted_out`, `email_sent`, `email_delivered`, `email_clicked`, `email_bounced`, `email_unsubscribed`, `email_replied`, `dm_received`, `appointment_booked`, `opportunity_created`, `opportunity_stage_changed`, `opportunity_won`, `opportunity_lost`, `workflow_entered`, `workflow_completed`, `social_post_engaged`.

## How data gets in

| Source | How |
|---|---|
| Vapi (Lani) | End-of-call data already goes to GHL and `voice_agent_calls`. I add a write to `lead_events`. |
| GHL forms, surveys, events | A GHL workflow sends a webhook to a Vercel function that writes the row. |
| Calculators and Rehab Estimator | The existing phone-check functions also write an event. |
| Property listing | The add, contact, and expiration functions also write an event. |
| Airtable history | One-time backfill, then a scheduled pull. |
| GA4 and social | A daily pull into a summary table. These are totals, not people. |

Calls, texts, and emails come from the GHL conversation history and the Vapi call data. GHL does not give email totals in one call, so I will pull each campaign and add them up myself. No keys go in code. The repo is public. All keys stay in Vercel env vars and LastPass.

### First dashboard views

These are plain SQL views on top of the two tables.

- Leads per week by channel
- Funnel: lead, engaged, trial, member
- Days from first touch to member
- Top campaigns by members, not just leads
- Lani calls, match rate, and no-match needs
- Calculator uses and trial to member rate

## Timeline

1. **Weeks 1 to 2.** Finish this list. Check what each source really gives me. Fix UTM capture.
2. **Weeks 3 to 5.** Create the two tables. Connect each source one at a time. Start with GHL forms and Lani.
3. **Weeks 6 to 8.** Build the dashboard with the top 10 numbers. Add the rest after.

## What I need from the team

- **Chris:** I need your call on what a lead and a member are, and a list of the numbers you check each week.
- **Harmonie:** which campaigns and links are live, so I can check UTMs.
- **Angela:** the list of forms and surveys that are in use today.
